Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Tq	Inhibition of proliferation or survival of, esp. malignant erbB2,
Id	cells - by introducing nucleic acid mol. encoding antibody homologue
Id	which is expressed and binds, pref. erbB2, protein intracellularly
Sđ	Disclosure; Page 29-30; 48pp; English.
ဂ္ဂ	A nucleic acid comprises a first sequence encoding a signal peptide
င္ပ	(R94019) linked to a second sequence (T17728) encoding a single
ဂ္ဂ	chain Fv fragment (R94020) that binds a human erbB2 oncoprotein.
33	The anti-erbB2 sfv portion is obtained by PCR using e23scfv
გ	plasmid as template. The signal peptide directs the scFv to the
ဂ္ဂ	endoplasmic reticulum. The nucleic acid is incorporated into a
გ	plasmid or viral vector to facilitate expression of the scrv antibody
ဌ	homologue within e.g. an epithelial carcinoma cell. Intracellular
ဂ္ဂ	
ဂ္ဂ	thereby inhibits cell proliferation and cell survival and decreases
G	
•	tumorigenicity.

Monoclonal antibody e23 was generated by immunising mice with N/erbB-2 cells overexpressing the gpl85 protein, removing spleen cells and producing hybridomas by standard techniques. Messenger RNA coding for the anti-erbB-2 monoclonal antibody was isolated and converted to cDNA. Regions coding for the heavy- and light- chain variable regions were then amplified by PCR and joined via a sequence encoding a peptide linker. The resulting single-chain antibody is useful for in vitro diagnosis of tumour cells which overexpress the erbB-2 gpl85 marker, e.g. breast, ovarian and non-small cell lung carcinomas, and, when coupled to a cytotoxic agent, to treat such tumours. DR N. Producing single chain Fv antibody in Escherichia coli - by PT producing single chain Fv antibody, followed by protein folding or by PT expression in an inclusion body, followed by protein folding or by PT co-expression with a chaperonin as a soluble fraction PS Claim 4; Page 6-7; 9pp; Japanese.

CC The sequences given in W25783-84 represent single chain Fv (scFv) CC antibodies which are produced in E. coli. The scFv's are derived CC either by: (1) expression as an inclusion body, followed by folding CC (i.e. by denaturation and solubilisation) or (2) expression as a CC soluble fraction by co-expression with chaperonin. Using the methods, CC scFv can be produced in E. coli, either in a soluble fraction or in CC inclusion bodies. Like the parent double chain antibodies, the scFv polypeptides are useful in immunological diagnosis or for separation CC and purification, but they lessen the side effects caused by antibody constant regions. The availability of scFv polypeptides contributes to fundamental research and development of diagnostic and therapeutic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          RESULT

Abs no. 21 and 23 are directed against the extracelular domain of gp185 erbB-2. Nude mice manipulated to produce rapidly growing tumours were used in a trial of the efficacy of the Abs. I engressed after 11 days.

MAb capable of binding to the gamma chain of the IL-2 receptor, and thus of blocking the IL-2 response, is produced by mouse hybridoma line GP-2 (FERM MP-4641). DNA encoding the variable region of this MAb was expressed in E. coli, yielding Fv(GP-2) with immunosuppressive activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Fv(GP-2) immunosuppressive.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Expression vector encoding bispecific fusion protein - having binding domains for separate targets joined by helical peptide, useful e.g. for diagnosis and treatment Example 1; Fig 11 and Page 29-31; 50pp; English.

Example 1; Fig 11 and Page 29-31; 50pp; English.

The VL and VH sequences of the anti-CD3 hybridoma G19-4 were amplified by PCR methods. A gene fusion was constructed from the two amplified domains and a (G194Ser)3 linker. The amino terminus of the VL-VH fusion cassette was fused at the SalI site to the L6 light chain variable region leader peptide and the carboxy-terminus was fused directly to the hinge region of the Fc domain at the BcII site and/or to a short "helical" peptide linker to construct the bispecific CD3-L6Fvlg antibody derivative. The variable regions for L6 were fused in frame to the opposite end of the helical linker (not included in R60206).

SC Claim 2; Columns 27-30; 28pp; English.

CThe present sequence represents a claimed single-chain antibody, designated e21(Fv), which binds to erbB-2. Monoclonal antibody e21 was generated by immunising mice with N/erbB-2 cells overexpressing the 9pl85 protein, removing spleen cells and producing hybridomas by standard techniques. Messenger RNA coding for the anti-erbB-2 monoclonal antibody was isolated and converted to cDNA. Regions coding for the heavy- and light- chain variable regions were then amplified by PCR and joined via a sequence encoding a peptide linker. The resulting single-chain antibody is useful for in vitro diagnosis of tumour cells which overexpress the erbB-2 gpl85 and, when coupled to a cytotoxic agent, to treat such tumours.

The source of human erbbs-2 protein for the prodn. of antibodies rather source of human erbbs-2 protein on its surface (N. (255180/R45442) is a NIH/3T3 cell engineered to express the human erbb-2 protein on its surface (N. erbb-2). Abs no. 21 and 23 are directed against the extracellular domain of gp185 erbb-2. Nude mice manipulated to produce rapidly growing tumours were used in a trial of the efficacy of the Abs. animals given a combination of the 2 Abs, tumours completely sequence 238 AA;

PT the serpin enzyme complex receptor, used in gene therapy of the Example 9: Pages 120-121; 158pp; English.

CC This represents an anti-human SC single chain Fv/protamine fusion protein Sequence containing a target binding molety capable of binding molety. CC This can be used in a method for delivering an oligonucleotide to a commandian cell. The method comprises conjugating the target binding cc mammalian cell. The method for delivering an oligonucleotide to a cc mammalian cell. The method comprises conjugating the target binding cc the carrier to an expression vector encoding one or more gene products to form a pharmaceutical composition. A mammalian cell having on its conface SECR, is contacted with the pharmaceutical composition under conditions allowing binding to the interior of the cell. The composition cc and method are used for the introduction of exogenous genetic material cc into target host cells expressing SECR on their surface. The nucleic acid may encode a functional wild-type or mutant gene or may be an antisense sequence or other nucleic acid having a therapeutic properties, cc e.g. enzymatic activity, cytokine activity and antibiotic activity which

MAb capable of binding to the gamma chain of the IL-2 recept
thus of blocking the IL-2 response, is produced by mouse byt
line GP-4 (FERM BP-6640). DNA encoding the variable region
this MAb was expressed in E. coli, yielding Fv(GP-4) with

antibody Fv fragments or single chain Fv molecules Disclosure; Fig 6; 51pp; English.
This sequence represents a single chain Fv molecule which contains the heavy and light variable portions (VH and VL) of antidigitoxin monoclonal antibody (MAb) 26-10 (see also R34670-71), a signal sequence (see R38527-28) and a linker between the two variable regions. The DNA sequence encoding this protein was used in the construction of an expression-secretion system for the production of biologically active Fv fragments. The system also contains a DNA sequence encoding the T7 promoter. The secretion-expression vector was produced by polymerase chain reaction Fv fragments
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          is delivered to a cell surface via the SECR binding moiety. The nucl acid can be compacted at high concentrations with the carrier molecu a critical salt concentration. The condensation of such complexes provides structural features to the DNA/cationic lipid complex that prolong in vivo expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                     Heavy; light; variable; VH; VL; region; antidigitoxin; monoclonal; antibody; MAb; 26-10; Fv; fragment; antigen; binding site; linker; expression-secretion system; T7 promoter; signal peptide; molecule polymerase chain reaction; PCR; single chain.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Q
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                នួននួន
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                밁
                                                                                                                  CC The multifunctional protein comprises a single chain biosynthetic Ab CC binding site (comprising sequences minicking the light chain and heavy CC chain variable regions of murine monoclonal 26-10) with the specificity CC of murine monoclonal 26-10, linked through a spacer to the FB fragment of protein A, here fused as a leader, and constituting a binding site for FC CC The spacer contains the 11 C-terminal amino acids of the FB followed by CC Asp-Pro ( a dilute acid cleavage site). The construct contains CC binding sites for both FC and digoxin, and its structure can be used for specific binding assays, affinity purificn. biocatalysts, targetting, CC imaging an immunological treatment of oncogenic and infectious diseases. CC imaging an immunological treatment of oncogenic and infectious diseases. CC improved stability. It reaches target tissues rapidly and its quickly cleared from the body. It also has reduced immunogenicity and its design CC facilitates binding to other moieties in drug targetting and imaging

                                                                                                                                                                                       for labelled or immobilised antibody, are less immunogenic, easier to engineer, more stable and less expensive Example 9; Fig 39A-B; 78pp; English.

Computer-designed construct 18-2-3/TRY202' (W02191), encoded by the DNA sequence given in T36463, comprises the variable regions of the light and heavy chains of anti-fluorescein monoclonal cantibody (Mab) 18-2-3 linked by a peptide designed to fit into a groove on the backside of the variable domain structure. The DNA construct was inserted into vector pGX3703 and introduced into E. coli. 18-2-3/TRY202' was produced as a single chain molecule. It cexhibited biological binding activity equivalent in specifically and affinity to that of the original MAb.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    21-MAY 1996.

It comprises a first polypeptide comprising the antigen binding portion of of the light chain variable region of an antibody and a second polypeptide comprising the antigen binding portion of the heavy chain variable region of an antibody and at least one peptide linker linking the first and second polypeptide chains. The resulting single chain polypeptide can be used in diagnostics, therapy (in vivo and in vitro), imaging, purifications and biosensors. This particular single chain binding molecule was designated 18-2-3Jrmx202' and contains one linker peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         23-MAY-1994 (first entry)
Single chain polypeptide with affinity for fluorescein.
Monoclonal antibody: MAb; affinity; binding; antigen; d
therapy; imaging; purification; biosensors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Synthetic.

Example 9; Fig 39; 78pp; English.

A DNA construct (713739) codes for single chain binding molecule

18-2-yTRY2020' (R99649), in which VL and VH regions of anti-

19 Index composed primarily of alternating Gly and Ser residues, with

C Glu and Lys residues to enhance solubility. The construct was

c expressed in E.coli. Soluble, folded chain antibody (SCA) was

c obtd. which was capable of exhibiting a biological binding activity

equivalent in specificity and affinity to that of a monoclonal

c antibody. SCAs (see also R99645-48 and T99650-51) have the

advantages of smaller size, greater stability and reduced cost.

Ig kappa chain V region - mouse
C; Species: Mus musculus (house mouse)
C; Date: 15-Feb-1991 #sequence_revision 13-Sep-1991 #text_change 20-Mar-1998
C; Accession: A34871
R; Chaudhary, V.K.; Batra, J.K.; Gallo, M.G.; Willingham, M.C.; FitzGerald, D.J.; Past: Proc. Natl. Acad. Sci. U.S.A. 87, 1066-1070, 1990
A; Title: A rapid method of cloning functional variable-region antibody genes in Esche: A; Reference number: A34871; MUID: 90138938
A; Reference number: A34871; MUID: 90138938
A; Accession: A34871
A; Status: preliminary
A; Molecule type: mRNA
A; Residues: 1-120 <CHA>
A; Cross-references: GB:M34000
A; Note: the authors translated the codon TTT for residue 88 as Pro
C; Superfamily: immunoglobulin V region; immunoglobulin homology
C; Keywords: heterotetramer; immunoglobulin

Ig light chain V region (S107/VH11 group 2-10) - mouse (fragment)
C;Species: Mus musculus (house mouse)
C;Date: 30-Sep-1993 #sequence_revision 30-Sep-1993 #text_change 30-
C;Accession: PT0397
R;Behar, S.M.; Lustgarten, D.L.; Corbet, S.; Scharff, M.D.
J. Exp. Med. 173, 731-741, 1991
A;Title: Characterization of somatically mutated S107 VH11-encoded A;Reference number: PT0376
A;Accession: PT0377
A;Molecule type: DNA
A;Residues: 1-107 <BEH>
C;Superfamily: immunoglobulin V region; immunoglobulin homology
C;Keywords: immunoglobulin
                                                                               A; Accession: S07453
A; Molecule type: protein
A; Residues: 1-43 < ROC2>
C; Superfamily: immunoglobu
C; Keywords: heterotetramer
                                                                                                                                                                                                            A; Title: Analysis of antibody diversity: V-D-J mRNA nucleotide sequence of fo hypervariable regions.
A; Reference number: S03471; MUID:84057768
A; Reference number: S03471
A; Rocession: S03471
A; Roclecule type: mRNA
A; Residues: 7-120 <ROCl>
A; Roclecule type: mRNA
A; Roclecule type: m
